

HUMANS VS BIODIVERSITY: INFLUENCE OF RECREATIONAL HIKING ON ANIMALS

By: Dev Patel

J.P. Stevens High School - Freshman

Eastern Coyote

White Tailed Deer

Red Fox

WHY SHOULD YOU CARE?

Habitat Destruction
Hunting of Predators
Human Disturbances

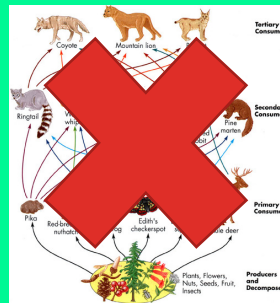

Decline in Predator
Species

Increase in
Mesoconsumer Species

The Destruction of
Ecosystems/ Food Chains

Many large predators
have been driven
away by humans
The goal for this project
is to see how humans
affect biodiversity

The understories of forests
to disappear

RESEARCH QUESTION 1 & HYPOTHESIS

Research Question 1

How do human disturbances (noise, habitat fragmentation, and recreational hiking) affect the presence of mesocarnivores in certain areas?

Hypothesis

If there is an area with more humans present, then predators are less likely to appear there.

If more humans are present in an area, then prey are more likely to appear there

RESEARCH QUESTION 2 & HYPOTHESIS

Research Question 2

How does predator lure affect the behavior of mesocarnivores?
Does it cause them to leave their comfort zones and force them to move closer to areas with more humans?

Hypothesis

If lure is used, then predators within a close proximity will be attracted toward the cameras.

STUDY DESIGN

Type of Project:
Experimental,
Observational

Experimental when
working with lure,
observational without
lure

Independent
Variable(s)

- Trail Usage
- Distance from Trail

12
CAMERAS

Dependent
Variable(s)

Presence of
Animals

6 split up
between
3 High Use Trails

EACH TRAIL

6 split up
between
3 Low Use Trails

EACH TRAIL

One
camera 10
meters
from trail

One
camera 50
meters
from trail

One
camera 10
meters
from trail

One
camera 50
meters
from trail

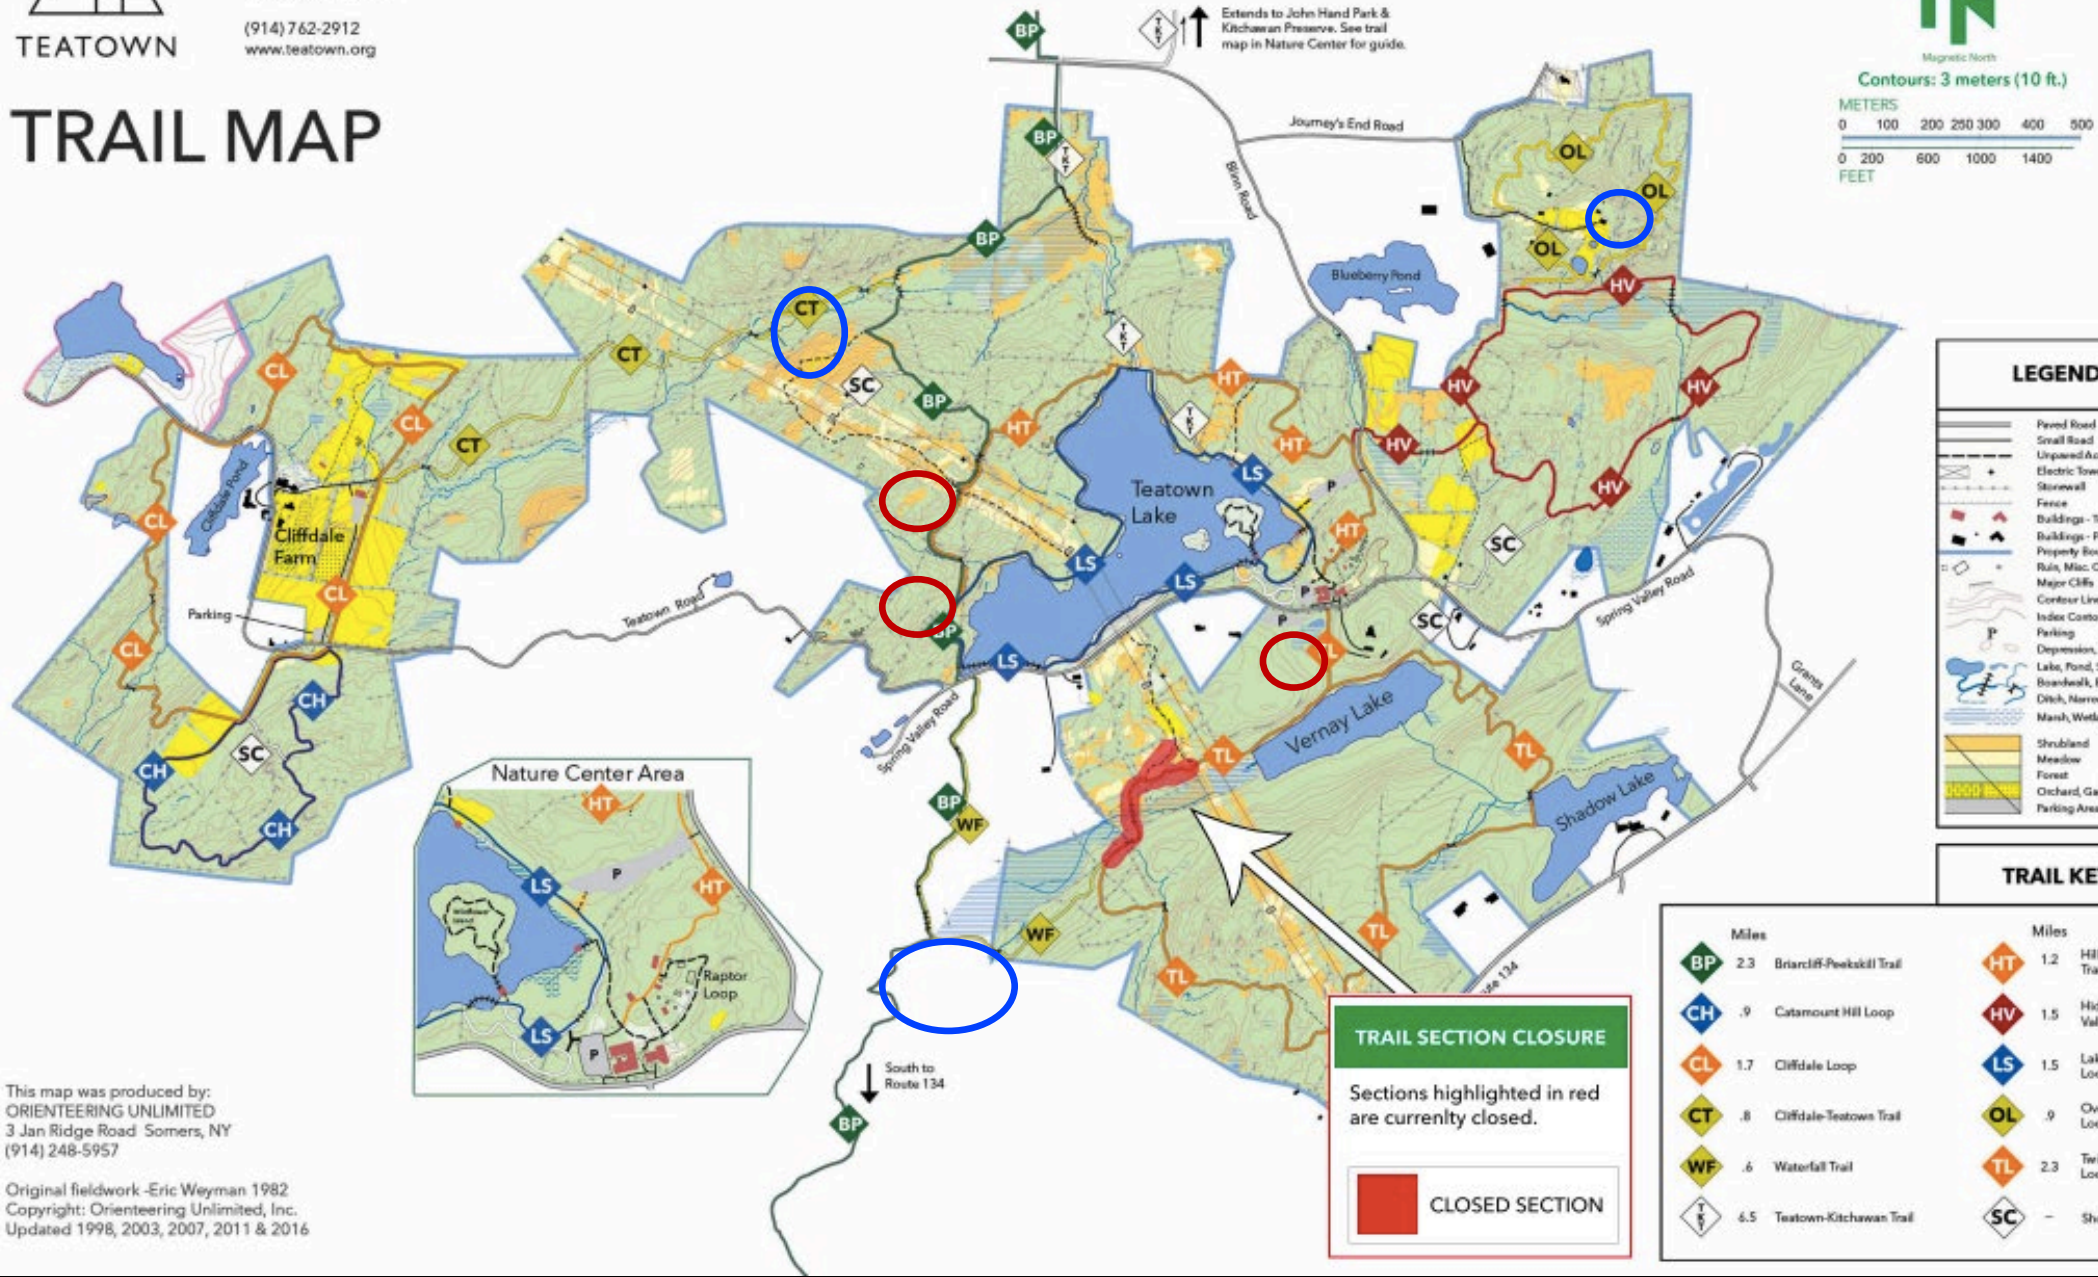

CAMERA
SETUP

Teatown Lake
Reservation
1600 Spring Valley Rd
Ossining, NY 10562
(914) 762-2912

Trail

METHODS

The Data Being Collected

Hiker Count

Number of hikers on a trail in a period of an hour

Usage of Lure

Whether lure was used to attract the animal towards the camera

Date/Time/ Temperature

The day the animal was captured on camera, what specific time, and how warm it was (F)

Animal Species

What type of animal it is and what role it plays in the food chain.
Example – Coyote/Predator

Trail / Trail Usage / Distance from Trail

The name of the trail, the usage of the trail (high or low), and how far the camera was from the trail (10m or 50m)

RESULTS

Figure 1. Hiker Count per Trail (1 hr)

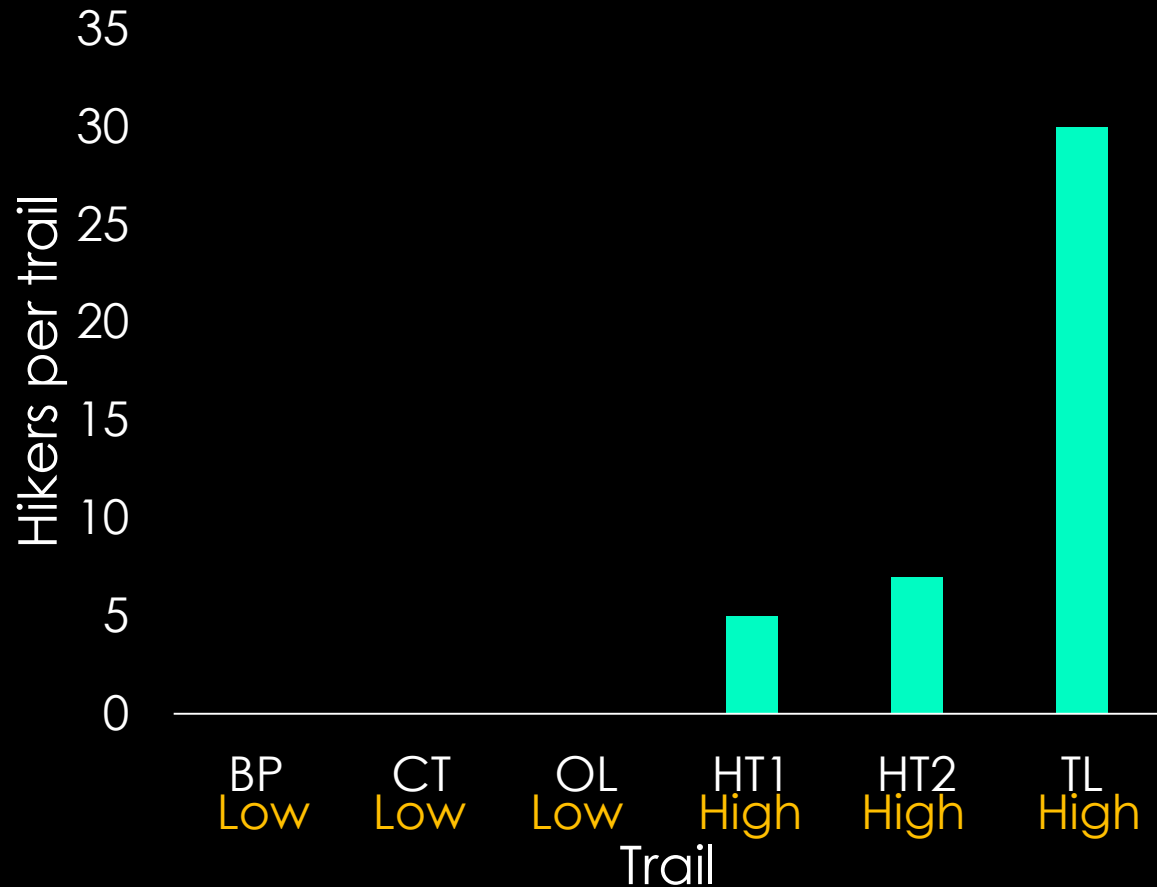

Figure 2. Events/Day with the Usage of Lure

RESULTS (CON.)

Figure 3. Total # of events at High and Low Use Trails

BP	White Tailed Deer
CT	White Tailed Deer
OL	White Tailed Deer
HT1	White Tailed Deer
HT2	White Tailed Deer Mourning Dove
TL	White Tailed Deer Squirrel

DISCUSSION - CONCLUSIONS

Lure was used for 6 days
There was no lure for 6 days

The overall results show that the predator lure had no effect on the experiment, as my hypothesis was negated. It is likely that the animals were not close enough for the lure to take effect
As a result, all the data was combined not including lure.

All the data collected
were prey items

Prey items were more
abundant on high use
trails; supporting my
hypothesis

Take Home Message

Prey were more common in areas with a higher usage by humans

In the Future

If this experiment were to be conducted again there would need to be more time to obtain more data

Sources of Error

This project was designed for a longer period of time as time was a limitation

Animals were not in close proximity for the lure to work

Hiker counts were not taken at the same time every day with similar weather conditions

ACKNOWLEDGEMENTS

I'd like to thank, Dr. Rubbo, Dr. Begley-Miller, Mike Tierney, all my fellow TESA students, and my parents
